INTRODUCTION

Trans Mountain Corporation (Trans Mountain) is committed to operating its pipeline system in a safe, efficient, and environmentally sound manner, adhering to all federal and provincial regulations. Trans Mountain's Public Awareness Program is focused on raising awareness about the presence of pipelines in the community and providing safety and damage prevention information to those who live and work near Trans Mountain's pipelines and facilities. Due to heightened federal and provincial regulations on pipeline safety and incident response, along with greater industry investment in these areas, the capacity to prevent and respond to pipeline incidents has significantly improved.

In the event of an unintended release from a Trans Mountain pipeline, the company, as the responsible party, will conduct full and complete response activities including remediation and recovery.

Trans Mountain has developed an Emergency Management Program that is based on a combination of regulatory compliance, operational need, industry best practices, and lessons learned through regular exercises and actual incidents. As part of Trans Mountain's commitment to work with Indigenous Communities to prepare for, respond to, and recover from potential incidents, Trans Mountain's Emergency Management Department has created this guide on pipeline safety and emergency response. The measures described in this supplement are aimed at reducing the potential impacts of an accidental release. This guide may be used to supplement your community's Emergency Response Plans (ERPs).

ABOUT THIS GUIDELINE

This guideline has been developed by Trans Mountain's Emergency Management Department for specific use by Indigenous communities. The information provided in this supplement does not replace that found within the community's emergency response plans but can enhance community resilience and support Trans Mountain's efforts to create a culture of pipeline safety and awareness. The guide is divided into three sections and supported by two (2) Appendices:

Section 1, "Preparedness," focuses on pipeline awareness and protective actions that should be followed in the event of a pipeline release. It provides general product characteristics and describes how to properly identify a pipeline release and steps that should be followed by community members if they witness or become exposed to a release.

Section 2, "Emergency Response," explains the framework of Trans Mountain's response to a pipeline incident. It outlines the procedures followed for internal and external notifications, provides a description of the Incident Command System (ICS) including Unified Command, and explains the various roles that Indigenous community delegates could undertake during response and recovery operations to a Trans Mountain pipeline incident.

Section 3, "Recovery," details the framework of Trans Mountain's recovery from an incident. This section covers the process for terminating and/or downgrading an emergency, demobilization of resources, and incident debriefing.

Appendix A is a glossary of select Trans Mountain and ICS terms relevant to emergency response.

Appendix B is a list of select Trans Mountain and ICS acronyms relevant to emergency response.

REGULATORY COMPLIANCE

Canada Energy Regulator

The Trans Mountain pipeline system falls under the jurisdiction of the Canada Energy Regulator (CER) and its applicable acts and regulations. The CER acts as the primary regulator for all interprovincial and international pipelines. The Board is responsible for monitoring how companies comply with regulations and commitments concerning the safety of employees, public, and the environment throughout the entire pipeline lifecycle. The CER's expectation, and Trans Mountain's, is that the top priority in any emergency is to make sure people are safe and secure, and that the environment and property are protected.

The CER has a comprehensive emergency management program. Any time there is a serious incident on a CER-regulated energy pipeline or facility, CER staff may attend the site to oversee the company's response. The CER requires that all reasonable actions are taken to protect the public, employees, and the environment. Further, the CER will verify that the regulated company conducts an adequate and appropriate clean-up and remediation of any environmental effects caused by the incident. Both the CER and the Transportation Safety Board can investigate the cause of an incident.

The CER maintains an Emergency Operations Centre in Calgary to coordinate and support its field staff at the incident site and provide situation reports to the Government of Canada's Emergency Operations Center in Ottawa.

The CER can be reached by calling **1-800-899-1265** or by using their online contact form located at <http://www.cer-rec.gc.ca/en/about/contact/index.html#contactusform>.

SECTION 1: PREPAREDNESS

1.1 Public Awareness

Pipelines provide a safe and reliable means of transporting Canadian energy products to market over long distances. However, incidents sometimes do occur, and when they do, Trans Mountain wants to make certain that local governments, Indigenous communities, and First Responders have the appropriate knowledge and awareness to ensure public safety.

Trans Mountain maintains a Public Awareness Program focused on ensuring members of the public remain well-informed of pipelines operating within their communities. A critical component of this program aims to ensure that individuals living and working in, and around active pipelines have the knowledge to both recognize a pipeline emergency and take appropriate actions. Understanding these two factors helps ensure personal safety as well as that of the community.

In addition, Trans Mountain has developed a Community Awareness Emergency Response (CAER) Program for community leaders and First Responders, including fire departments and the police. The CAER Program informs participants about identifying pipeline locations, types of products transported, product hazards, and emergency situations involving a pipeline release, including safety procedures to be followed. The CAER Program's goal is to achieve an effective and coordinated response partnership with the communities in which Trans Mountain operates.

Communities can play an important role in mitigating risk to pipelines. Government and industry statistics show that improper or unauthorized digging near a pipeline is the most common cause of pipeline damage. Community leaders can help protect the public, environment, and pipelines by being aware of the requirements for safe digging near the federally regulated pipelines and by contacting local One Call service prior to starting any ground disturbance activities:

One Call Service numbers:

- Utility Safety Partners (Alberta) 1-800-242-3447
- BC1 Call (British Columbia) 1-800-474-6886
- Or visit: Clickbeforeyoudig.com

Landline and cellphone calls made to One-Call centres are tollfree from anywhere in Alberta or BC. In BC, on the TELUS or Rogers mobility system, call *6886 and free airtime will also be provided.

Listed below are six things community leaders can do to help protect their communities from potential pipeline emergencies:

1. Alert Trans Mountain if you see or become aware of any potentially dangerous activity near a Trans Mountain pipeline at **1-888-876-6711**.
2. Require excavators and landscapers working in the community to contact the local One Call service before digging to request the location of buried utilities. If an activity is near the Trans Mountain pipeline, Trans Mountain will be notified and will take the following steps:

- Call the excavator back within three business days to discuss the proposed work.
 - Provide a 'Trans Mountain 30 metre Permit' if ground disturbance activity to a depth of 30 cm or greater within 30 metres from the centre of the pipe is to take place and/or a Proximity Permit for appropriate underground installations or crossings within the right-of-way.
 - Schedule an appointment to meet and mark the location of the pipeline and discuss next steps as required.
 - Conduct a safety meeting to explain the markings and applicable regulations and requirements.
 - Provide a Pipeline Protection Inspector to be on-site for any approved work within 7.5 metres of the pipe.
3. Advise excavators, landscapers, or other construction personnel to report if they come in contact with the pipeline or see any pipeline damage, including gouges, dents, scrapes or exposed areas of pipe.
 4. If pipeline easements exist within the community, review the details of any agreements, and talk with Trans Mountain before planting, digging, or building near the right-of-way.
 5. Inform and educate members of the community about the signs of a potential pipeline leak and the location of pipelines (see Section 1.3).
 6. Review pipeline emergency response procedures within the community's Emergency Response Plan including evacuation and shelter-in-place procedures. Liaise with Trans Mountain for discussions when reviewing or updating applicable emergency response procedures.

1.2 Pipeline Markers

People who live and work near Trans Mountain's pipelines are encouraged to familiarize themselves with the pipeline's right-of-way. A pipeline right-of-way is a linear corridor of land kept free of tall growing vegetation and permanent structures to allow pipeline operators access to inspect, maintain, repair, and test the pipelines.

Trans Mountain maintains permanent signs, or markers, along the pipeline route and at road and railroad crossings to aid with right-of-way identification. Markers identify that the pipeline is in the area, but not its exact location or depth. Markers display important information about the pipeline, including the product transported, the pipeline operator's name, emergency contact number, and the local One Call number.

1.2.1 Types of Pipeline Markers

Right-of-Way Marker

Casing Vent Marker

Aerial Marker

Road Markers

***The Emergency Number for Trans Mountain is
1-888-876-6711***

1.3 How to Identify a Pipeline Release

A member of the community may identify a pipeline release, either real and/or suspected, by understanding the common signs of a pipeline release listed below.

Smell

- Chemical or petroleum odours (like gasoline or diesel fuel)
- Sulphur or rotten eggs smell

See

- A pool of liquid near the right-of-way
- A rainbow sheen on water
- Dead or discoloured vegetation

Listen

- Unusual noises such as roaring or hissing

In the event a pipeline release from a Trans Mountain operated pipeline is identified or suspected, immediately call Trans Mountain's 24-hour Emergency Number at:

1-888-876-6711

1.4 Top Pipeline Safety Tips for Communities in the Event of a Pipeline Release

In the event of a pipeline release, community leaders can provide their communities with information on what **to do** in the event of a pipeline release.

Leave the area immediately, on foot and upwind.

- Abandon any mechanized equipment being used in or near the area.
- Call Trans Mountain's 24-hour emergency line **1-888-876-6711**.
- Warn others to stay away.
- Eliminate ignition sources (e.g. keyless door entry, cell phone or flashlight).
- Turn off vehicle engines.

DO NOT:

- Re-enter the area.
- Ring doorbells or metal knockers; knock with your hand to avoid sparks.
- Operate pipeline valves.
- Touch any liquid or vapour.
- Start your vehicle or drive into the release location or vapour clouds while leaving the area.
- Try to extinguish any fires associated with the release; wait for trained professionals.

SECTION 2: EMERGENCY RESPONSE

2.1 Reporting a Pipeline Release

When members of the community identify or suspect a pipeline release from a Trans Mountain operated pipeline, they should immediately notify Trans Mountain's 24-hour Emergency Line.

***The Emergency Number for Trans Mountain is
1-888-876-6711***

2.2 Information to Report

When contacting the Control Centre, to help gather as much information about the incident as possible, try to be as clear, concise, accurate, and timely as possible. Be prepared to report:

- Your name and telephone number
- Date and time of the call
- Location of suspected pipeline release

2.3 Product Description

The products carried in Trans Mountain pipelines have common characteristics. These characteristics may be helpful in identifying a pipeline release.

Characteristic	Synthetic Crude/Refined Product
Appearance	Light brown or yellow liquid
Odour	Similar to gasoline or diesel fuel
Behaviour	Synthetic crude flows with land profile Vapours are heavier than air
Volatility	Flammable (-50°C to -40°C flash point) and explosive properties, especially when first released
Other	H ₂ S may be present in low concentrations, less than 10 ppm

Note: H₂S is extremely poisonous.

2.4 General Protection Methods

Once the extent of the pipeline emergency has been determined, your community leadership should work with First Responders to decide which response actions to take. The most common immediate response actions for pipeline emergencies are:

Move away from the incident area AND shelter-in-place (stay indoors)

OR

Evacuate

The decision to evacuate or shelter-in-place is based upon multiple factors including:

- Location of the release.
- Potential exposure to the release during evacuation.
- Anticipated duration of the emergency.
- Advice from Emergency Responders and/or Trans Mountain personnel.

If exposure to the release is imminent, or if evacuation is likely to expose individuals to harmful substances, then sheltering-in-place is the most suitable strategy. If advised to evacuate, or if it is safe to leave the affected area, then evacuation procedures should be followed.

The following are guidelines to assist community members to carry out safe and effective shelter-in-place and evacuation procedures.

2.5 General Shelter-In-Place Guidelines

- Notify community members of the need to shelter-in-place.
- Remain indoors until further instructions are given. If outside when alerted, proceed to nearest safe building.
- Inform community members to complete the following actions while indoors:
 - Shut down the buildings heating and cooling systems.
 - Turn off local fans.
 - Close doors and windows.
 - Seal gaps under doors and windows.
 - Seal vents if possible.
 - Turn off sources of ignition, such as pilot lights.
- Remain in place until given the all-clear by local officials.

2.6 General Evacuation Guidelines

- Notify community members of the need to evacuate.
- Instruct individuals to evacuate their homes and other occupied buildings and follow the community's designated evacuation route or the directions of First Responders.
- Evacuate to the designated meeting point or reception centre. If the assigned meeting point is deemed unsafe, determine, and communicate alternative location(s).
- Determine the best mode of transportation. This may include walking, or if safe, the use of buses and personal vehicles.
- Check in with appropriate staff at the meeting point or reception centre.
- Remain in place until given the all-clear from the appropriate officials.

SECTION 3: TRANS MOUNTAIN EMERGENCY RESPONSE

3.1 Emergency Levels

A potential emergency can be defined as a release of unknown volume, unconfirmed and is adjacent to water or where there is a pathway to water, and the environmental conditions, such as rain events or known shallow groundwater make impacts to water likely.

The incident will be identified and classified into Trans Mountain's three-tiered response structure. Each tier is managed by an escalating degree of management seniority and authority, and assistance from outside the initial response organization.

Level	Definition	Examples
1	The Company has the capability to manage and control a Level 1 emergency using company resources available within the area. The District Supervisor will assume the Incident Commander position.	<ul style="list-style-type: none"> • Oil releases confined to company property (pipeline station, terminal, or scraper trap) • Public, contractor, or employee safety not endangered • Public property not endangered • Local response handled by District personnel • Notification may not be required to regulatory authorities • Little or no media interest
2	The Company has the capability to manage and control a Level 2 emergency using company resources and expertise, with some assistance from local contractors. The Region Director or designate may assume the Incident Commander position.	<ul style="list-style-type: none"> • Oil has migrated beyond company property (pipeline station, terminal, or scraper trap) but not into a waterway • Emergency services may be required • Public, contractor, or employee safety and/or property may be endangered • Notification required to regulatory authorities • May use a Unified Command organizational structure • Local media interest
3	The Company may request assistance from other industry, municipal, or state agency personnel to support the response to the incident. The Region Director will assume the Incident Commander position.	<ul style="list-style-type: none"> • Major emergency condition such as: <ul style="list-style-type: none"> ○ Uncontrolled leak ○ Release on a watercourse ○ Large fire at an operating facility or office building ○ Fatality or serious injury to an employee, contractor, or the public ○ Release of hazardous substances • Major off-site environmental impact has occurred • Public, contractor, or employee safety and/ or property is endangered • Emergency services are required • Notification required to regulatory authorities • Use of a Unified Command organizational structure to facilitate coordination of company, government, and other agency response to the emergency • Local, provincial/state, and/or national media interest

3.2 Trans Mountain Initial Notification Procedure

After a pipeline release has been reported and confirmed, the Control Centre will begin the internal and external notification processes.

With regards to external entities, Trans Mountain follows a procedure that notifies First Responders and emergency response contractors.

If a community is affected by an incident, Trans Mountain will notify the community as soon as possible. Communities downstream from the emergency, potentially at risk, or likely to be impacted will be promptly notified.

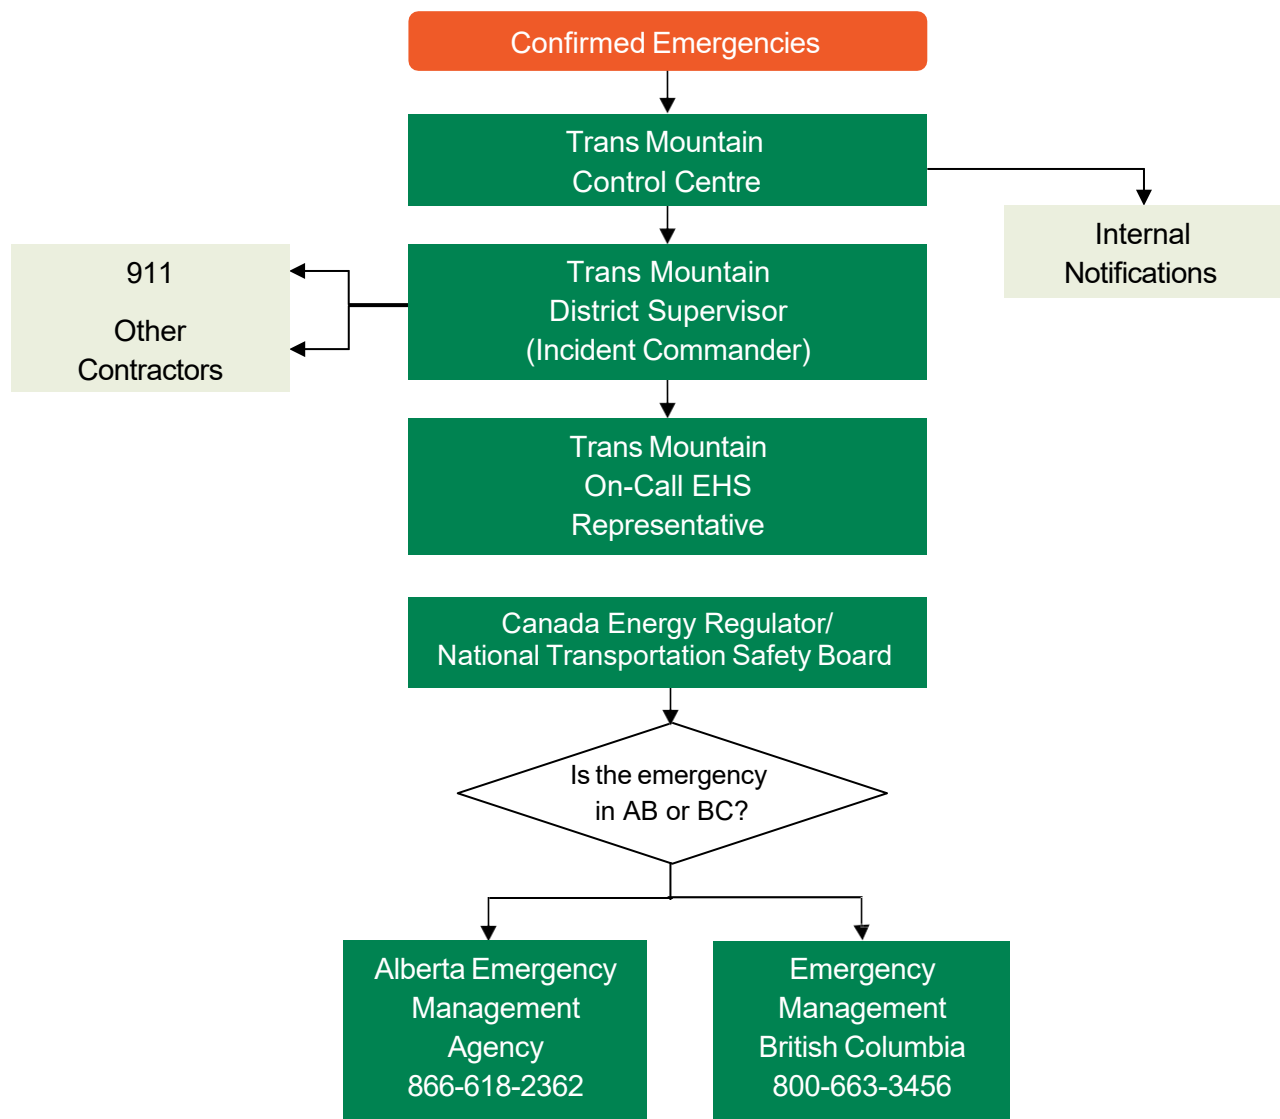

Figure 1. Notification process

In addition to the above initial notifications, the following entities are notified:

- Indigenous Groups
- Provincial emergency management agencies
- Various regulatory agencies (Ministry of the Environment, Department of Fisheries and Oceans, etc.)
- Municipal and Regional Governments and Counties
- Health authorities

3.2.1 Notification to Impacted Indigenous Communities

Impacted communities will be identified based on the location of the incident and by using Trans Mountain’s Geographic Information System (GIS) mapping applications. Trans Mountain maintains a database of information for Indigenous communities located along the pipeline, including Traditional Territories, and will confirm that these communities have been notified in the event of an incident, through the Liaison Officer.

Trans Mountain recognizes that in some situations a provincial response may not be required; however, communities and/or other potentially impacted entities may wish to receive additional information regardless of the decision to participate in the response by the provincial or federal governments. Therefore, Trans Mountain is committed to making additional notification calls, as time allows, and to establish a conference call to ensure potential responders are aware of the situation.

3.2.2 Regulatory Notifications

Emergency condition notifications are made to the National Transportation Safety Board (NTSB) and Canada Energy Regulator (CER), Emergency Management British Columbia (EMBC), and/or Alberta Emergency Management Agency by Trans Mountain as per the applicable regulation.

The CER is notified of emergency and safety shutdowns when a potential or actual emergency has been identified.

The NTSB is notified of significant incident if an acute event that results in: death, missing person, a serious injury (as defined in the Onshore Pipeline Regulations (OPR) or Transportation Safety Board (TSB) regulations), a fire or explosion that causes a pipeline or facility to be inoperative, a LVP hydrocarbon release in excess of 1.5 m³ that leaves company property or the right-of-way, a rupture; or a toxic plume as defined in the Canadian Standards Association Z662 Oil and Gas Pipeline Systems. For the purposes of this document, a “rupture” is an instantaneous release that immediately impairs the operation of a pipeline segment such that the pressure of the segment cannot be maintained.

Please contact Trans Mountain at 1-403-514-6400 and ask to speak to an Indigenous Relations Team member if the emergency contact information for your community changes.

BC Ministry of Environment and Climate Change Strategy and Alberta Environment and Alberta Energy Regulator must be notified if a spill release enters, or is likely to enter, a body of water, or the quantity of the substance released is, or is likely to be, equal to or greater than the listed quantity for the listed substance.¹

If there is some doubt as to whether an event should be reported or whether an event has occurred, a potential event will be reported at the very least.

3.3 Incident Command System (ICS)

Trans Mountain responds to all real or potential emergencies using the Incident Command System (ICS). The ICS is a standardized incident management tool used for meeting the demands of a range of incidents both large and small. It allows for the integration of equipment, facilities, personnel, and communications within a common organizational structure. The ICS is used to establish near and long-term response operations ensuring that all facets of the incident are managed. This command structure also enables members of Indigenous groups, the federal government, provincial government, local authorities, and the responsible party (Trans Mountain) to work together towards mutually agreed upon goals, ultimately focused towards effective and efficient response.

In the unlikely event of a pipeline emergency Trans Mountain will establish an Incident Command Post (ICP) near the incident location, typically in hotels or a community center. The ICP is the central location from which primary command and incident management functions are directed.

3.4 Unified Command

Based upon the incident, and wherever possible, Trans Mountain aims to establish a Unified Command structure for emergency response. Unified Command's responsibility during an incident is to provide overall guidance and support to respond to the incident. This is achieved through establishing key objectives, identifying response priorities, and following an inclusive decision-making process. Unified Command sets the direction of response activities including developing and implementing strategic decisions, endorsing Incident Action Plans (IAPs), and approving the order and release of resources. The Unified Command maintains situational awareness of the incident and its evolving hazards and will confirm the community has updated information to aid in its decision-making on public safety. Members of the Unified Command will support the community in the implementation of the public safety measures.

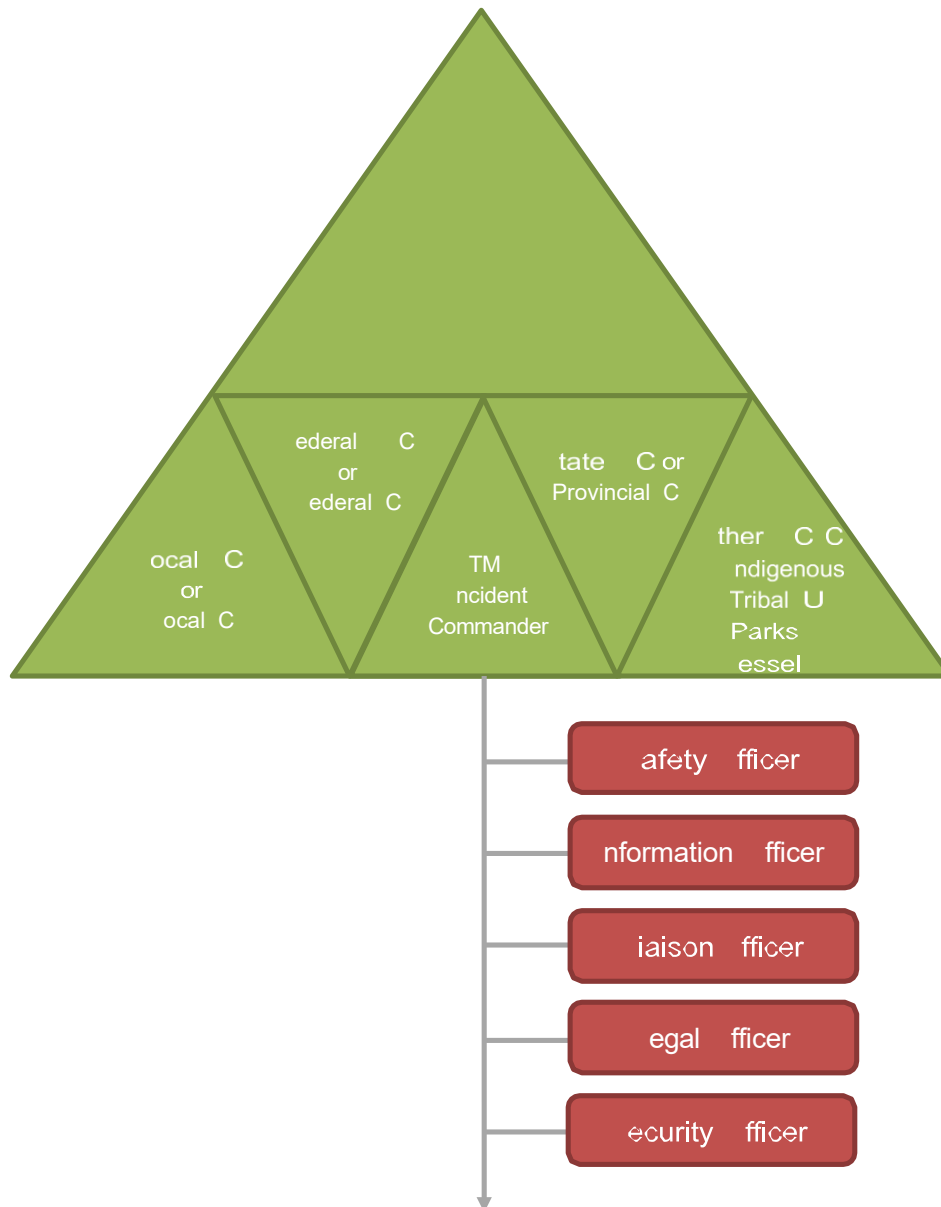

Unified Command is composed of:

- Federal Representative
- Provincial Representative
- Indigenous Community Representative

¹ BC Spill Reporting Regulation, 2023

- Fire Chief or identified Representative of the local government where the incident originates
- Trans Mountain Representative
- Other government representative, as applicable (Parks, etc.)

For emergencies in which Indigenous communities and/or their territories are impacted by a pipeline release, Trans Mountain will invite appropriate representatives from these communities to participate in Unified Command. Indigenous communities possess local and traditional knowledge that is critical to a rapid, effective, and coordinated emergency response, and representation in Unified Command will ensure interests of the community are represented at the highest level of decision-making.

It is important to note that Unified Command is not used in all situations. In some instances, and typically for smaller sized incidents, a single Incident Commander from Trans Mountain may exercise authority. In such cases, the appointed Liaison Office will ensure that any impacted Indigenous communities are informed of the incident. The Liaison Office will then remain in contact with the affected parties until the incident phase is terminated.

When community representatives are asked to join the Incident Command Structure, they will be contacted by the Liaison Office and asked to join Trans Mountain representatives at the local ICP. Once representatives arrive at the ICP, they will be asked to sign in and will be greeted by a representative of the Liaison Office. The Liaison Office coordinates with all stakeholder groups including those assisting and cooperating with emergency response efforts.

Before sending personnel to the incident location, inform them of the need to check in with Trans Mountain responders at the ICP. This ensures an accurate list of who is on-site and that they receive safety instructions, or training, before entering the incident site.

After being greeted at the ICP, community representatives will be given a workspace in which they can put aside personal belongings and set up a workstation. The Liaison Office will then determine where representatives will be best situated within the overall ICS structure to aid in response efforts.

3.5 Additional ICS Roles

There are many roles in which Indigenous representatives may participate outside of Unified Command.

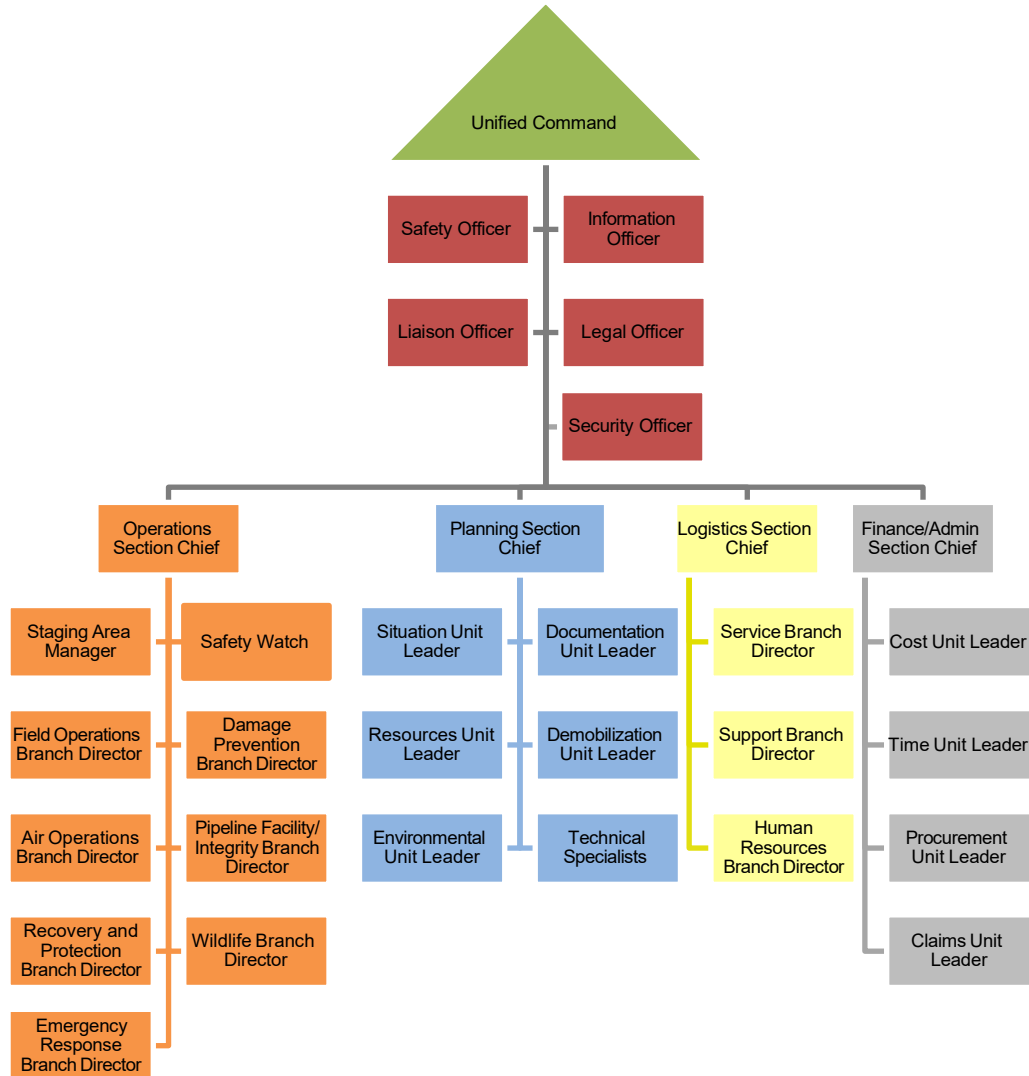

Figure 2. Typical response organization structure, from Trans Mountain – 2024, Incident Command System Guide

Some of these roles are located within the ICP while others are at the incident site. The specifics of these roles are typically determined by the nature of the incident. One example is serving as a community representative within the Liaison Office, providing knowledge of the impacted area that can assist Unified Command in determining response objectives. Other roles that Indigenous community representatives may be asked to participate or assist with include the Environmental Unit located within the Planning Section and/or the Operations Unit.

3.5.1 Liaison Office

Indigenous representatives, other than those on direct tactical assignments or participating in Unified Command, may assist in the response through the Liaison Office. Responsibilities include:

- Ensuring that all Indigenous attendees are properly checked-in at the incident.
- Attending briefings and planning meetings as required.
- Cooperating with the Incident Commander and the General Staff on Indigenous involvement at the incident.
- Ensuring the well-being of Indigenous attendees assigned to the incident.
- Advising the Liaison Officer of any special Indigenous attendees needs or requirements.
- Reporting to home community and/or territory dispatch or headquarters on a prearranged schedule.

3.5.2 Operations Unit

Having knowledge of the land and its resources, Indigenous representatives with specialty skills may assist the Operations Section in a number of areas. One example is in the event of an incident requiring on-water operations. In these instances, this specialist may serve as a guide assisting boat captains to navigate local water bodies. Other specialists may be assigned to the Wildlife Branch tasked with minimizing wildlife impact after a pipeline release.

3.5.3 Environmental Unit

The Environmental Unit is responsible for environmental matters associated with the response, including strategic environmental assessment, modeling, surveillance, and permitting. Local government personnel and technical specialists participating in the Environmental Unit may assist in the development of incident specific plans such as air monitoring, waste management, and/or environmental sampling plans.

SCAT Team – Shoreline Cleanup and Assessment Technique (SCAT) is a systematic method for surveying an affected shoreline after an oil spill. As a SCAT Team member, Indigenous representatives may support response efforts by sharing their local knowledge of shoreline characteristics, attending site visits with SCAT Teams to highlight any shoreline changes and providing insight regarding local wildlife populations and other sensitivities at risk.

Science Table – As a member of the Science Table, Indigenous representatives may be asked to provide environmental advice and assist with setting key priorities including the determination of resources at risk. The Science Table includes representation from environmental response agencies such as Environment Canada, provincial environmental ministries, and scientists. The Science Table is tasked with classifying environmentally sensitive resources that require protection, determining rehabilitation priorities and identifying any historical or culturally sensitive areas at risk.

3.6 Supplemental Plans

Supplemental Plans are considered a subset of the Emergency Response Plans and provide guidance on the assessment and management of particular hazards and/or consequences that may arise during an incident. Trans Mountain's list of supplemental plans include:

- Convergent Volunteer Management Plan
- Decontamination Plan
- Ground Water Assessment Plan
- Non-Floating Oil Assessment and Response Guide
- Public Health Assessment and Response Plan for Airborne Health Risks Associated with Pipeline/Terminal Operations and Incidents (previously titled Air Monitoring Plan)
- Sampling and Monitoring Plan
- Waste Management Plan
- Wildlife Management Plan

3.7 Crisis Communications Plan

In addition to ERPs and supplemental plans, Trans Mountain has developed a Crisis Communication Plan. The Plan is designed to ensure the Company has adequate resources and processes in place to respond to the information needs of its stakeholders, customers, government and regulatory officials, the public, and media during an emergency.

SECTION 4: RECOVERY

4.1 Terminating/Downgrading the Response

The decision to terminate and/or downgrade emergency operations and to demobilize personnel and equipment shall be made on a site-specific basis and based on the status of the incident. Factors that may affect the decision to terminate/downgrade the response include:

- The emergency condition has been controlled and immediate threats to the health and safety of the public have been eliminated.
- Any leaks or releases that have been contained, and all remaining free oil, petroleum products, or hazardous materials have been recovered from the site.
- Repair operations have been undertaken to prevent further releases from occurring.
- Further emergency operations at the site will cause more damage to property and the environment than that which resulted from the release initially.

The Trans Mountain Incident Commander or designee shall consult appropriate government agencies and other involved parties before making any decisions related to terminating/downgrading response activities. These agencies and involved parties include representatives from local Indigenous communities and agencies.

4.2 Incident Debriefing

Incident debriefing is a critical component of response and will be organized by Trans Mountain in consultation with participating agencies, local communities, provincial, and federal government representatives, and other relevant stakeholders.

The incident debriefing includes a review of the participant's role in the response, the event chronology, and the incident response phases. When discussing the event chronology, aspects that may be discussed include the completed incident briefing, mapping, and the activated ERPs. Reviewing the incident response phases is an opportunity to note learnings regarding the initial notification, response team activation, initial response actions, and public notification and safety management.

The review process enables participants to voice their perspective. For large groups, breakout groups may be used to help identify key points and action items. Responsibilities, accountabilities, and timelines should be assigned to all action items.

CONCLUSION

As no two emergencies are ever the same, the role of Indigenous representatives within the Incident Command System may vary. Nevertheless, when an incident impacts, or has the possibility of impacting, Indigenous peoples and their land, their assistance within the Incident Command Post will prove essential.

For more information about the Emergency Management Program, or to view Trans Mountain's emergency response plans and documents, please visit:

APPENDIX A – GLOSSARY OF SELECTED TRANS MOUNTAIN AND ICS TERMS

Abandoned Pipeline – A pipeline or section of pipeline de-commissioned and no longer in use. Abandoned pipelines may be left in place or removed, with appropriate measures taken to restore the natural environment after removal.

Advanced Response Equipment – Additional supplies of equipment that is more specialized and/or additional equipment already part of the initial response. This includes fire-fighting equipment, fire-fighting foam, oil tracking technologies, wildlife response equipment, additional boom, storage, and recovery equipment. See also **Initial Response Equipment**.

Agency Representative – Individual assigned to an incident from an assisting or cooperating agency who has been delegated full authority to make decisions on all matters affecting his/her agency's participation at the incident. Agency Representatives report to the Liaison Officer upon arrival at the ICP.

Assisting Agency – An agency which directly contributes tactical or service resources in support of an incident response.

Clear Text – The use of plain English in radio communications transmissions. No Ten Codes nor agency specific codes are used when using Clear Text.

Control Centre – A room or rooms containing computer and electronic monitoring systems designed to assess pipeline and infrastructure status on a 24/7 basis. The Trans Mountain Pipeline Control Centre is located in Edmonton. The Control Centre has the ability to remotely start, limit, or halt the flow of product within some or all of the pipeline.

Control Point – A location specific response tactic used to contain or recover oil. A river, stream or creek may include many control points along its path where response resources (boom, skimmers, etc.) may be deployed. Control Points are described in the Emergency Response Plans.

Convergent Volunteers – Individuals, typically members of the public, and not requested by Trans Mountain, who converge upon an emergency site in order to provide service and support to response activities following an emergency. Trans Mountain does have a plan and resources allocated to manage convergent volunteers who may offer their support.

Cooperating Agency – An agency supplying assistance other than direct tactical, support, or service functions or resources to the incident control effort (e.g., Red Cross, telephone company, etc.).

Decontamination Trailer – A trailer use to transport equipment to facilitate the cleaning of personnel and small equipment. Decontamination trailer equipment ensures that when personnel leave an impacted area, they do not track contaminants with them. Equipment includes wash stations, pools, tents, detergent, hand sprayers and other equipment.

Emergency Management – Management of an emergency or incident. The Trans Mountain ICS organization is designed to fulfill the emergency management role.

Emergency Operations Centre (EOC) – A pre-designated facility established by an agency or jurisdiction to coordinate the overall agency or jurisdictional response and support to an emergency response.

Emergency Response Equipment – Equipment dispatched to the incident site that is specific in nature to affect the response. This does not include pipeline and/or facility repair crews. However, it does include recovery equipment and temporary storage equipment. Trans Mountain divides Emergency Response Equipment into two categories: Initial Response and Advance Response Equipment.

Emergency Response Plan (ERP) – A documented set of guidelines and procedures required to respond to an emergency within the plan's stated scope. Trans Mountain currently has four (4) ERPs: Terminals, Trans Mountain Pipeline, Trans Mountain Pipeline (Puget Sound), Westridge Marine Terminal.

Geographic Information System (GIS) – An electronic information system, which provides a geo-referenced database to support management decision making.

Geographic Response Plan (GRP) – A documented set of procedures and guidelines which identify and describe sensitivities, including natural and cultural resources, and other geographically specific information relevant to emergency response, such as Control Points. GRPs complement and support ERPs. For example, there are four (4) separate GRPs supporting the Trans Mountain Pipeline ERP.

Hydrogen Sulphide (H₂S) – A gas which may be present in or given off by crude oil, synthetic crude oil, and/or refined products. Natural gas containing relatively high concentrations of H₂S is referred to as "sour gas"; H₂S smells of rotten eggs and is extremely poisonous.

Initial Isolation Zone - The geographical area near a continuous hazardous release where all non-response personnel should be evacuated as there may be an immediate danger to life and health for those not protected by appropriate PPE as the result of the incident.

Incident Management Team – A minimum group of trained Trans Mountain responders located at the Incident Command Post filling the following positions: Incident Commander, Safety Officer, Information Officer, Legal Officer, Liaison Officer, Operations Section Chief, Planning Section Chief, Environmental Unit Leader, and Logistics Section Chief. Additional positions within the Incident Management Team will be staffed as follows: Finance Section Chief, Staging Area Manager, Situation Unit Leader, and Documentation Unit Leader.

Incident Management Support Team – Individuals who are tasked with support roles in the operation of the Incident Command Post and who will not fill leadership positions.

Initial Response Equipment – The first piece(s) of equipment on-site including temporary air-monitoring equipment that may be used to protect the public, employees, or environment.

Joint Information Centre (JIC) – A facility established within, or near, the Incident Command Post where the Information Officer and staff can coordinate and provide incident information to the public, news media, and other agencies or organizations. The JIC is normally staffed with public information representatives from participating agencies, government, and from Trans Mountain.

Jurisdiction – A range or sphere of authority. At an incident, public agencies have jurisdiction related to their legal responsibilities and authority for incident mitigation. Jurisdictional authority at an incident can be political/geographical (e.g., city, county, provincial, or federal boundary lines), or functional (e.g., police department, fire department, health department, etc.).

Jurisdictional Agency – The agency having jurisdiction and responsibility for a specific geographical area or a mandated function.

Liaison Officer (LO) – A member of the Command Staff responsible for coordinating with stakeholder groups and representatives from assisting and cooperating agencies.

Multi-Agency Incident – An incident where one or more agencies assists a jurisdictional agency or agencies. May be single or Unified Command.

Multi-Jurisdiction Incident – An incident requiring action from multiple agencies that have statutory responsibility for incident mitigation. In ICS, these incidents will normally be managed using a Unified Command.

OSCAR Trailer – Oil Spill Containment and Recovery Trailer - A large, truck drawn trailer containing various tools and release response equipment ranging from absorbent materials and skimmers to booms and other clean up tools specific to the area in which the trailer is located.

Pipeline Markers – Permanent signs along the pipe-line right-of-way and road and railroad crossings and above ground facilities. Pipeline markers display information such as the product carried and the emergency contact number. Pipeline markers indicate the general location of the pipeline.

Potential Emergency – A release of unknown volume, unconfirmed and is adjacent to water or where there is a pathway to water, and the environmental conditions, such as rain events or known shallow groundwater make impacts to water likely.

PPE – Personal Protection Equipment – equipment or clothing worn by personnel meant to provide protection from various hazards that may be encountered when responding to a pipeline emergency. Typical PPE includes gloves, Fire-Resistant coveralls, boots, respirators, goggles, etc.).

Protective Action Zone - The geographical area associated with a credible worst-case incident that is used to educate community members on the public safety measures, including evacuation or shelter-in-place, that may be required during an incident due to the potential for an imminent threat to health. This area will be adjusted during an incident to account for the actual incident type and the safety measures required to mitigate potential impacts to the public. May be referred to by other entities as the Emergency Planning Zone (EPZ).

Resources – All personnel and major items of equipment available, or potentially available, for assignment to incident tasks on which status is maintained.

Responsible Party (RP) – The owner/operator of the infrastructure which is the release source.

Right-of-way – A linear corridor of land kept free of tall growing vegetation and permanent structures to allow safe pipeline access for visual inspection, maintenance and emergency response. **RP Incident Commander (RPIC)** – Trans Mountain's designated incident Commander.

Rupture – An instantaneous release that immediately impairs the operation of pipeline segment such that the pressure of the segment cannot be maintained.

Source Control – Actions necessary to control the release source and prevent the continued release of oil or hazardous substance(s) into the environment.

Unified Command (UC) – A unified team which manages an incident by establishing a common set of incident objectives and strategies.

APPENDIX B – ACRONYMS

CER	Canada Energy Regulation
EOC	Emergency Operations Centre
EMBC	Emergency Management BC
ERP	Emergency Response Plan
GIS	Geographic Information System
H₂S	Hydrogen Sulphide
IAP	Incident Action Plan
IMT	Incident Management Team
IRT	Incident Response Team
JIC	Joint Information Centre
KP	Kilometer Post
NTSB	National Transportation Safety Board
OPR	Onshore Pipeline Regulations
SCAT	Shoreline Cleanup and Assessment Technique
